
FUNDAMENTAL OF PROGRAMMING
TERM PROJECT
CRN 20821

DATE: 19.04.2022

DUE: 27.05.2022

BRIEFING

- The assignment contains two main parts. Each of these requires an understanding of basic surveying problems.
- The necessary theoretical background of each part is given throughout this document.

Part-I: Open Traverse Computation

Part-II: Electronic Tacheometry Computation

CONTENTS

	Page
PART-I: Open Traverse Computation	3
PART-II: Electronic Tacheometry Computation.....	6
Python Input/Output Examples	9
Input List for Each Student.....	11

PLEASE NOTE THAT

- The term project should be submitted as a compressed file (*.zip or *.rar) which contains python script written in python (*.py) file(/s). Any other format uploaded to the NINOVA system (such as *.doc, *.docx, *.png, *.jpg) will be graded as 0(zero).
- The script files must be named as "StudentID.py" (for example, "01010000.py"). In case there are more than one questions, python script name must include question number (for example, "01010000_1.py", "01010000_2.py").
- All python script file(/s) must be compressed as "StudentID.zip" (for example, "01010000.zip" or "01010000.rar".)
- This homework is an individual work that means you should not work as groups. Any copied code or similarities as examples of plagiarism will cause your homework graded as 0 (zero).
- You can USE any code examples given in the presentations or uploaded by yourself during the laboratory hours in your homework freely, however you SHOULD cite these quotation parts clearly in your code with the code example number, week number, and/or slide numbers in the presentations.
- In the homework you should add “_” and the four three digits of your student ID to

all variable names. For example, if your student ID is 015163628 then a program like

```
a = int (input("Enter a number: "))
b = int (input("Enter a second number: "))
print ('The sum of ', a, ' and ', a, ' is ', a+b )
should be written like
a_3628 = int (input("Enter a number: "))
b_3628 = int (input("Enter a second number: "))
print ('The sum of ', a_3628, ' and ', b_3628, ' is ', a_3628+b_3628 )
```

Otherwise your program will be graded as 0 and if the variable names are of someone else's then course grade will be graded as (VF).

- For Electronic Tacheometry Calculations, the height of station point 102 is 110.000 meter for all students.

PART-I: OPEN TRAVERSE COMPUTATION

PROBLEM DEFINITION:

- Write a program to calculate coordinates of stations that are established as an open traverse.
- The input values (known coordinates, traverse angles, length of traverse sides, traverse point IDs) for the program should be entered by the user manually.
- The results of the calculations should be printed to the screen using proper notation as given in the examples.
- Every component of the calculation should be clearly explained to the user before and after the calculation.

THEORY:

Open Traverse (see Fig.1) does not create a closed shape and begins at a point of known position and ends at a point of unknown position. In computational check, it is not possible to detect errors or blunders in distance and directions.

To calculate the coordinates for each point on a traverse, the direction and distance from a known point must also be known.

Once azimuth values and the distances of traverse sides are known, the latitude (ΔX) and departure (ΔY) can be calculated.

The coordinates of the unknown point can then be determined by algebraically adding the latitude to the northing of the known point and the departure to the easting of the known point (see Table. 1).

Figure 1: Open traverse

EXAMPLE: Calculate the coordinates of unknown points 1, 2 and 3 using the coordinates of known points A and B, and related direction and distance measurements in the open traverse given below.

Point ID	Coordinates (m)	
	Y	X
A	8450.00	9300.00
B	8575.00	9125.75

$$\beta_B = 98^\circ.3570$$

$$\beta_1 = 255^\circ.6520$$

$$\beta_2 = 207^\circ.8930$$

$$S_{B1} = 175.58 \text{ m}$$

$$S_{12} = 168.75 \text{ m}$$

$$S_{23} = 184.94 \text{ m}$$

Solution: Calculate the azimuth between points A and B:

$$t_{A,B} = \arctan \left| \frac{\Delta Y}{\Delta X} \right| = \arctan \left| \frac{Y_B - Y_A}{X_B - X_A} \right| = \arctan \left| \frac{125.00}{-174.75} \right| = 39^\circ.5290 \quad (1)$$

Considering that $\Delta Y > 0$ and $\Delta X < 0$ the azimuth angle is supposed to be in the second quarter,

$$t_{A,B} = 200^\circ - 39^\circ.5290 = 160^\circ.4710$$

Now, it is possible to find the other azimuth angles in the open traverse serie. Starting with $t_{B,1}$,

$$K = t_{A,B} + \beta_B \quad (2)$$

$$\left[\begin{array}{l} \text{If } K < 200^\circ \rightarrow t_{B,1} = K + 200^\circ \\ \text{If } 200^\circ < K < 600^\circ \rightarrow t_{B,1} = K - 200^\circ \\ \text{If } K > 600^\circ \rightarrow t_{B,1} = K - 600^\circ \end{array} \right] \text{ Conditions of next azimuth angle} \quad (3)$$

Thus,

$$\begin{aligned} K &= t_{A,B} + \beta_B \\ &= 160^\circ.4710 + 98^\circ.3570 \\ &= 258^\circ.8280 \quad (K > 200^\circ) \\ t_{B,1} &= 258^\circ.8280 - 200^\circ \\ &= 58^\circ.8280 \end{aligned}$$

After all azimuth angles are computed, ΔX and ΔY between points can be calculated as,

$$\Delta X_{n,n+1} = S_{n,n+1} \times \cos(t_{n,n+1}) \quad (4) \quad \Delta Y_{n,n+1} = S_{n,n+1} \times \sin(t_{n,n+1}) \quad (5)$$

$$\begin{aligned} \Delta X_{B1} &= S_{B1} \times \cos(t_{B,1}) \\ &= 175.58 \times \cos(58^\circ.8280) \\ &= 105.80 \text{ m} \end{aligned} \quad \begin{aligned} \Delta Y_{B1} &= S_{B1} \times \sin(t_{B,1}) \\ &= 175.58 \times \sin(58^\circ.8280) \\ &= 140.12 \text{ m} \end{aligned}$$

Finally, the coordinates of unknown points are computed by simply adding ΔX and ΔY values to known coordinates sequentially,

$$X_{n+1} = X_n + \Delta X_{n,n+1} \quad (6) \quad Y_{n+1} = Y_n + \Delta Y_{n,n+1} \quad (7)$$

$$\begin{aligned} X_1 &= X_B + \Delta X_{B1} \\ &= 9125.75 + 105.80 \\ &= 9231.55 \text{ m} \end{aligned} \quad \begin{aligned} Y_1 &= Y_B + \Delta Y_{B1} \\ &= 8575.00 + 140.12 \\ &= 8715.12 \text{ m} \end{aligned}$$

PART-II: ELECTRONIC TACHEOMETRY COMPUTATION

PROBLEM DEFINITION:

- Write a program to calculate an electronic tacheometry computation.
- The input values (coordinates and heights of station point and coordinates of target traverse points, measured horizontal and vertical angles for detail points, instrument and reflector heights, point IDs) for the program should be entered by the user manually.
- The results of the calculations should be printed to the screen using proper notation as given in the examples.
- Every component of the calculation should be clearly explained to the user before and after the calculation.

THEORY:

Tacheometry is a method that is used to determine the location of topographic details. This method determines the polar coordinates of detail points via horizontal angle and horizontal distance from stations and their elevation via slope distance and vertical angle. Electronic tacheometric observations can be carried out by using a total station and reflector.

The steps of tacheometry measurement are as follow;

1. The instrument (i.e total station) is set on the station point P102. The height of the instrument (h_i) is measured.
2. The horizontal zero direction of the instrument in traverse point P102 (denoted as 0g.0000 in Fig.2) must be fixed to the previous traverse station P101.
3. The reflector (shown in color red in Fig.3) is located on the detail point to be measured. The height of the reflector (h_r) is measured.
4. Vertical angle is measured either as zenith or nadir, depending on the instrument. In calculations, the geometric relations are formulated based on the zenith angle (Z).
5. Finally, the slope distance is measured between traverse point P102 and detail point

Figure 2 Tacheometry measurement (plan view)

Figure 3: Trigonometric levelling (section view)

EXAMPLE: A total station has been setup at point P_{102} and referenced to point P_{101} in order to carry out an electronic tacheometry process for a detail survey. By using the coordinates and heights of the point P_{101} and P_{102} and given measurements, calculate the coordinates and height of detail point 1 (The geometry is as given in Fig.3).

Point ID	Coordinates (m)		Height (m)
	Y	X	
P101	3540.650	2360.420	110.600
P102	3740.650	2360.420	125.100

Station ID	Target ID	Horizontal Direction (g)	Vertical Angle (g)	Slope Distance (m)
P102	P101	0.0000		
$h_i = 1.50$ m $h_r = 2.00$ m	1	111.0554	99.8568	82.576
	2	180.5545	99.1000	96.425
	3	209.7820	101.1700	103.647

Solution: To find the elevation of detail point, the height difference between the station traverse point and the detail point must be calculated via trigonometric levelling method. In this method, the height difference ΔH (see Fig.4) is calculated as,

$$\Delta H = S' \times \cos(Z) + h_i - h_r \quad (9)$$

So, for the point 1,

$$\Delta H = 82.576 \text{ m} \times \cos(99^{\circ}.8568) + 1.50 \text{ m} - 2.00 \text{ m} = -0.314 \text{ m}$$

The elevation of the point H_1 can be found as,

$$H_1 = H_{P_{102}} + \Delta H = 124.786 \text{ m}$$

Horizontal distance between traverse station and detail point can be calculated using slope distance and zenith angle.

$$S = S' \times \sin(Z) \quad (10)$$

For the point 1 the horizontal distance is calculated as,

$$S_{P_{102}-1} = S'_{P_{102}-1} \times \sin(Z_1) = 82.576 \text{ m}$$

To calculate the coordinate of the detail point, one must find the azimuth angle from traverse station to the detail point (i.e. $t_{P_{102},1}$). Azimuth can be calculated since their coordinates are already known. To find the azimuth $t_{P_{102},1}$, recall the Equation (2),

$$K = t_{P_{101},P_{102}} + \beta_1$$

$$\left[\begin{array}{l} \text{If } K < 200^{\circ} \rightarrow t_{P_{102},1} = K + 200^{\circ} \\ \text{If } 200^{\circ} < K < 600^{\circ} \rightarrow t_{P_{102},1} = K - 200^{\circ} \\ \text{If } K > 600^{\circ} \rightarrow t_{P_{102},1} = K - 600^{\circ} \end{array} \right] \text{ Conditions of next azimuth angle}$$

Now, we have everything we need to calculate the coordinates of point 1 (horizontal distance S and azimuth angle). Use Equations (4) and (5) to calculate $\Delta X_{P_{102}-1}$ and $\Delta Y_{P_{102}-1}$, and Equations (6) and (7) to calculate the coordinates X_1 and Y_1 .

$$\begin{aligned} X_1 &= X_{P_{102}} + S_{P_{102}-1} \times \cos(t_{P_{102},1}) \\ &= 2360.420 + 82.576 \times \cos(11.0554) \\ &= 2441.754 \text{ m} \end{aligned}$$

$$\begin{aligned} Y_1 &= Y_{P_{102}} + S_{P_{102}-1} \times \sin(t_{P_{102},1}) \\ &= 3740.650 + 82.576 \times \sin(11.0554) \\ &= 3754.918 \text{ m} \end{aligned}$$

PART III: PYTHON INPUT/OUTPUT EXAMPLES:

Part I: Open Traverse Calculation:

```
>>>
This program calculates the coordinates in open traverse serie

Enter the point ID of first known point      : A
Enter the Y coordinates of first known point (m): 8450.00
Enter the X coordinates of first known point (m): 9300.50

EVALUATION CRITERIA FOR HOMEWORK

	Unsatisfactory	Good	Excellent	Total
Program execution	*Program does not execute (0pt)	Program executes correctly with no syntax or runtime errors (15pt)		15pt (max)
Correct output	Output is incorrect (0pt)	Output has minor errors such as format errors (30pt)	Program displays correct output with no errors (50pt)	50pt (max)
Design (Input Design, Comments, Solutions)	Inefficient design and solution (0pt)	Implemented with some incomplete explanations Solution is efficient but there are unnecessary steps (25pt)	Clearly and effectively documented, and implemented with properly defined explanations. Solution is efficient, easy to understand, and maintain (35pt)	35pt (max)
Total	0pt	70pt	100pt	100pt(max)

*If program does not execute, other evaluation criteria will not be checked and homework will be graded as 0 (zero) point.

NOTE: Any questions for homework, please contact Res.Asst. Bilal MUTLU and Res.Asst.Koray AKSU

Res.Assist. Bilal Mutlu E-Mail: mutlubil@itu.edu.tr

Res.Assist. Koray AKSU E-Mail: aksuko@itu.edu.tr
